

RegionX Overview

Motivation

We believe Polkadot has the best technology in the industry for onboarding the next generation of projects from other ecosystems. The benefits of bringing new projects into the ecosystem are two-sided: Polkadot gains from receiving new projects, while the projects benefit from relatively cheap and flexible blockspace. With bridging technologies such as Hyperbridge and Snowbridge, we believe that projects will no longer choose where to deploy based on liquidity, but instead on the ecosystem that offers the most affordable, secure, and flexible blockspace.

Goal

Our goal is to create a platform that provides affordable blockspace, enabling us to onboard the next generation of projects into the Polkadot ecosystem.

Why Polkadot?

With the transition to Agile Coretime and what the RegionX parachain offers, we believe Polkadot can and should become the go-to platform for hosting rollups. The ecosystem already hosts a good number of rollup(parachain) projects, and with the transition to Agile Coretime, it will be possible to host many more projects at an affordable cost without compromising security.

Acquiring blockspace for rollups on Polkadot costs a fraction of what it does on blockchains like Ethereum, as Polkadot has been specifically optimized for hosting parachains.

Not only are deployment and maintenance more affordable, but developing a rollup is also much easier, making the process less time-consuming and cost-effective. Substrate and Cumulus provide a great framework for developing blockchain projects, which is why we can see other ecosystems, like Cardano, choosing to adopt them for their own purposes.

Who are we targeting?

Our goal is to target projects that can gain the most value from deploying on Polkadot. Our initial focus will be on new Ethereum L2 projects or existing smart contract projects with a high level of activity.

Developing an L2 is complex, time-consuming, and expensive. Most Ethereum L2 rollups fall into one of two categories: Optimistic rollups or ZK rollups.

Polkadot offers a solution for rollups that does not fall under either of the two categories. It provides a much more efficient solution, as Polkadot is specifically designed for hosting rollup chains (parachains).

Due to this, Ethereum projects that move to Polkadot will experience cheaper blockspace, easier, faster, and more cost-effective development, without compromising on security as many rollup chains do.

We, the RegionX team, will provide these teams with development and consultancy support to help them deploy their projects sooner and more securely.

Tokenomics

Coretime is a product produced by Polkadot. It is offered in bulk sales and can be purchased with DOT. Given Coretime's close association with Polkadot, we believe that DOT should be the currency used for purchasing it, even on secondary marketplaces like RegionX.

However, with RegionX being the main retail market for Coretime, its currency aims to capture the value produced by the marketplace and to provide governance over the market's economic parameters and configuration.

The RegionX token will initially serve three main purposes:

- Capture the fees collected by the marketplace and other related services
- Govern the marketplace parameters and configuration.
- Governance over the RegionX treasury.

Development Services

Once the parachain is deployed, a key focus of the team will be to provide development and consultancy services to the L2s we onboard to Polkadot.

These services will be offered by the RegionX team through a company (currently under Master Union LLC, with a new company to be established for this purpose).

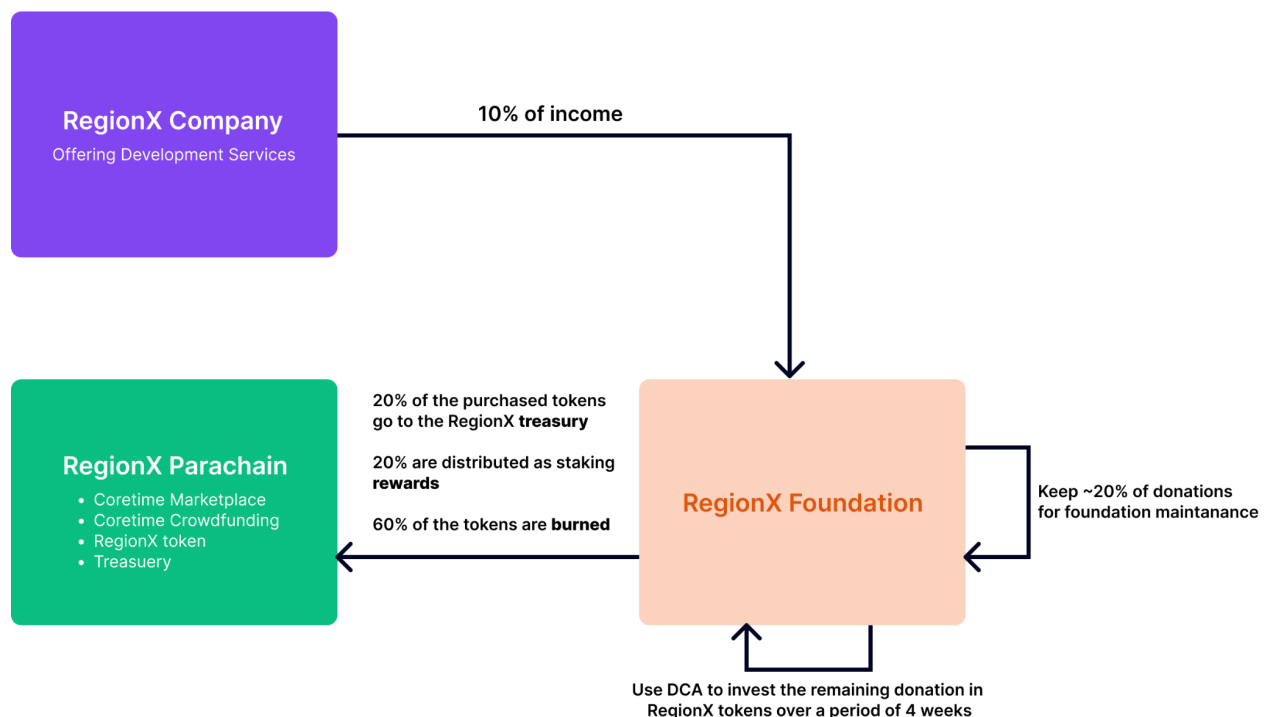

We believe that the Polkadot ecosystem has a strong need for a dedicated team focused on onboarding projects from other ecosystems.

The best part is that everyone benefits: Polkadot gains more projects, the onboarded projects experience significantly lower development and deployment costs, and the RegionX team becomes self-sustaining, allowing us to enhance our services and continuously improve the parachain with more useful features.

Furthermore, we want to further align the company's success with the RegionX parachain. For this, we took inspiration from the BNB Chain.

Our approach is similar to the buyback system initially used on the BNB Chain, where Binance buys back and burns tokens. The main differences are that, instead of allocating a portion of the profit, we will allocate a portion of the company's income. Additionally, a portion of the tokens will be sent to the treasury rather than being entirely burned.

This process is outlined in the diagram below:

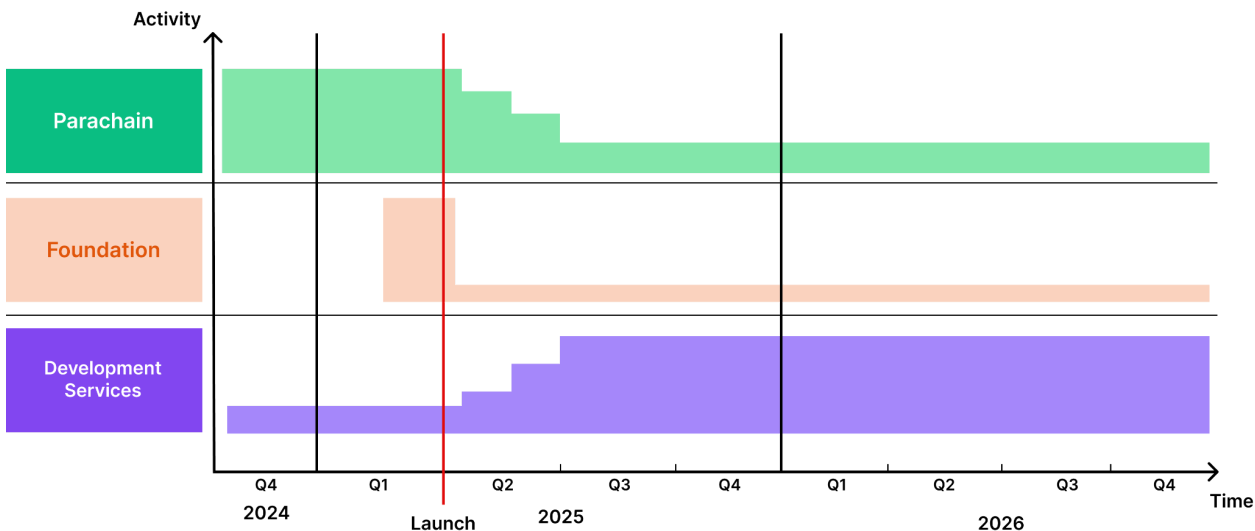

This means token holders will additionally benefit from the foundation buying back and burning RegionX tokens, which will increase demand and reduce the total supply.

The token will be deflationary, with the goal of reducing the total supply over time, thereby making the token more scarce and valuable.

Roadmap

The image below provides a high-level overview of our activities for the upcoming period. Additionally, we have included a more detailed description of the team's focuses during this time period.

2024 Oct. - 2025 Feb.

Parachain Activities

By the end of 2024 and the start of 2025, we will implement tokenomics-related functionality and prepare the runtime for deployment on Polkadot. It is also important to note that during this period, we will work on improving the UX, as well as enhancing the UI by transitioning to a more refined and professional design.

The primary focus of the tokenomics will be to incentivize staking on collators. This will involve capturing fees from the marketplace, Coretime crowdfunding, and other related services.

Once this functionality is implemented and the parachain runtime is prepared, the auditing process will start, which may take some time.

Foundation

Prior to launch, part of the team will work on establishing a nonprofit foundation with the purpose of supporting the RegionX parachain. The foundation will receive a portion of the initial token supply and periodic donations from the RegionX company.

Development Services

Even though our main focus during this period will be preparing the parachain for launch on Polkadot, we will begin communicating with teams and projects from other ecosystems that may transition to Polkadot.

We will work on expanding the team to include more Substrate developers; however, initially, based on the projects we onboard, we will aim to hire developers on a contract basis for specific projects. This approach allows us to select the best-fit individuals for each project we help onboard.

2025 Mar. - 2025 Jun.

Parachain Activities

During and after the audit, we will address any issues identified in the report to ensure everything is ready for release.

Once the audit is complete and all fixes have been applied, we will proceed with deploying the parachain on Polkadot by the end of March or the beginning of April.

Once the parachain is launched we will continue to closely monitor it and work on improving the UI and UX of the RegionX Coretime Hub web app.

During this phase after the launch there won't be as much activity as during the development phase, but it is still important to closely monitor, gather feedback and make smaller fixes and improvements to the parachain and the frontend.

With the available treasury, a good initial use for it is to reward teams for developing automated Coretime trading bots and market makers. We aim to have developers outside our team working on this to encourage greater community engagement.

Having a well-functioning trading bot and a market maker will be sufficient to simplify Coretime procurement for parachains, as there will be parties automatically fulfilling Coretime orders.

Foundation

After the setup, aside from ongoing monitoring, there won't be much activity around the foundation.

Development Services

Once the parachain is deployed and running on Polkadot, we will be able to focus more on providing development services. Around this time, we aim to secure our first client, who we will assist with development and onboarding onto Polkadot. This will help the company become self-sustaining, while also donating a percentage of the income to the foundation, which will manage the funds as described above.

2025 Jul. - 2026 Dec.

Parachain Activities

After the parachain has been live for some time and there are trading bots and market makers in place, it will be fully functional and ready for use by any parachain in the ecosystem.

The development of the parachain will primarily shift to maintenance mode, though we will continue adding features that benefit parachains using RegionX for Coretime procurement. One such feature could be an insurance subscription, allowing parachains to receive a smaller fraction of a Polkadot core allocation if they fail to procure Coretime on time. This way they are guaranteed that the parachain will never stop with block production.

During this period, we will be in discussions with current parachain teams, assisting them in utilizing RegionX for Coretime procurement to reduce costs, engage the community, or purchase Coretime during periods of high demand.

Foundation

Aside from ongoing monitoring, we don't expect additional activity unless there is a good reason at the time.

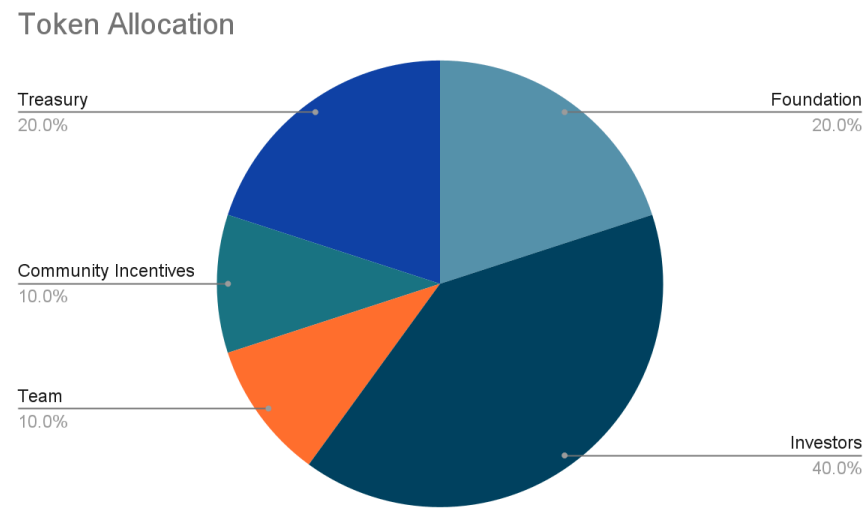

Development Services

During this time, we'll be able to focus more on providing development and onboarding services. We expect to grow by bringing in more and bigger projects to the Polkadot ecosystem.

These development services will be our primary source of income, helping to cover the maintenance of the parachain, ongoing improvements, and the development of new services.

We believe this creates a win-win situation: we can onboard projects to the ecosystem while being profitable, the RegionX parachain benefits from gaining more users and increasing demand for its token, and the Polkadot ecosystem grows by welcoming more projects.

Token Allocation

If the entire 40% allocated to investors is not distributed, the unallocated amount will be divided equally between the foundation and the treasury, with each receiving half.

Suggested Vesting Schedule

We aim to minimize the risk of sudden sell-offs by implementing a reasonable vesting schedule, designed to ensure long-term stability and mitigate such risks.
